SRS updates

- Revise the use cases to reflect the current workflow: administrators upload, review, and publish datasets; users explore approved fields, create reports, and export PDFs.
- Replace legacy references to “cards” with “reports” throughout the SRS, including use cases and acceptance criteria.

Dataset page (`/dataset`)

- Condense the overview into a compact summary beside or beneath the dataset title, such as **ACS 5-Year Town Profile**.
- Replace the long, stacked page with tabs for **Data preview**, **Fields**, and administrator settings.
- Make **Data preview** the default tab, with a brief dataset summary and dynamically calculated row and field counts.
- Use dataset-neutral wording. Display “170 rows” when applicable without assuming each row represents a unique town.
- Rename the report action to **Create a report with this data** and carry the selected dataset into the report builder.

Administration (`/admin`)

- Simplify the page around browsing and managing existing datasets.
- Provide a distinct **Add dataset** button that opens a dedicated upload form.
- Add search, column sorting, and filters to the dataset table, including filters for reporting period, publication status, and field-review status.
- Create an admin navigation area with separate destinations for **Data management** and **Manage users**.

Report builder and charts

- Generalize the report builder to support datasets organized around locations, categories, or other records, without requiring town-based selections.
- Populate field choices from the selected dataset’s approved fields, using their display names, data types, and units.
- Adapt selection and filtering controls to the dataset’s available fields. Offer indicators and geographic comparisons only when applicable.
- Generalize chart creation so users can select category or axis fields, numeric measures, series, and compatible chart types from the dataset.
- Preserve individual source rows unless the user explicitly chooses an aggregation, and keep incompatible units on separate scales or charts.
- Make report and chart titles easy to add and edit, with meaningful defaults based on the selected dataset and fields.
